

## Connect your wallet to a website with Liquid Connect

SIDESWAP GUIDE Liquid Connect

Available for:

### LIQUID CONNECT

## Connect your wallet to a website

Liquid Connect lets you use your SideSwap wallet on websites such as sideswap.io. A website you connect can see your balances, but it can never move your funds. You approve every payment and every swap in your wallet.

[sideswap.io/guides/connect-your-wallet](https://sideswap.io/guides/connect-your-wallet) · Updated 9 Oct 2026

## At a glance

A website sees

Balances, assets and history  
Of this wallet, past and future

A website can

Ask, never spend  
Every payment and signature is approved in your wallet

You approve with

Allow or Reject  
Each request shows how long it stays open

Works with

SideSwap on your phone or computer

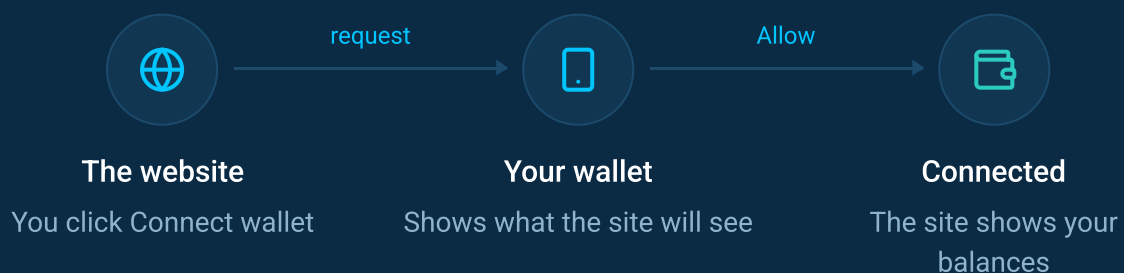

## Before you start

- ✓ A SideSwap wallet. New to SideSwap? Start with [Get started](#).
- ✓ The website and your wallet on the same network. A page on testnet needs a wallet on testnet.
- ✓ A website you trust. Connecting shares your full history with it.

## How it works

You start on the website and finish in your wallet. The website never gets your keys. It sends requests, and your wallet shows each one for you to approve.

### ONE CONNECTION

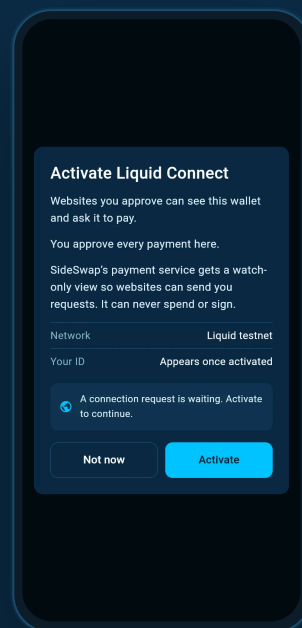

# Step by step

## 1 Activate Liquid Connect

The first time, your wallet asks you to activate Liquid Connect. You can also start it from the Liquid Connect card on Home. Activating gives SideSwap's payment service a watch-only view, so websites can send you requests. It can never spend or sign. If a website is already waiting, the wallet says so. Tap **Activate**.

Activate Liquid Connect

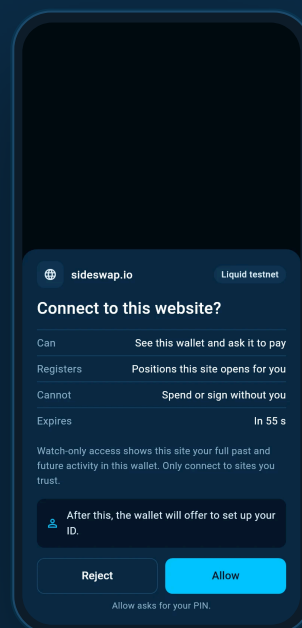

## 2 Click Connect wallet on the website

On sideswap.io or another website that supports Liquid Connect, click **Connect wallet**. On a computer, choose **Desktop** to open the SideSwap app on that computer, or **Mobile** to scan a QR code with the app on your phone. On a phone, the link opens the app and brings you back afterwards.

## 3 Check the request

Your wallet shows the site and its network, then what the site can do. It can see this wallet and ask it to pay, it records positions it opens for you, and it cannot spend or sign without you. The request expires after the time shown.

Connect to this website?

4

## Allow

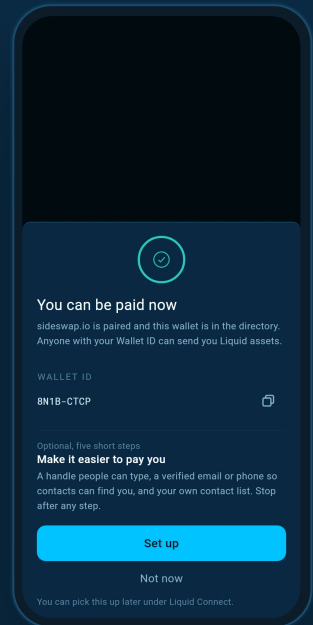

Tap **Allow** if the site is the one you are on. If you use a PIN, Allow asks for it. The website now shows your balances. Tap **Reject** if you did not start this or do not trust the site.

5

## You can be paid now

On Liquid testnet, after your first website, the wallet tells you it is in the directory. Anyone with your Wallet ID can now send you Liquid assets. Tap **Set up** to add a handle and contacts, or **Not now**. You can pick this up later under Liquid Connect, see [Get paid with a handle](#). Liquid mainnet has no directory yet, so this step does not appear there.

You can be paid now

## What a website sees

Can see

Addresses, balances, assets and history  
Of this wallet, past and future

Can ask for

Payments, swaps and signatures  
Each one waits for your approval

Can record

Positions it creates for you  
Your wallet checks each one against the chain

Can never

Spend, sign or see your recovery phrase

### **Connect only to sites you trust**

Watch-only access shows a site your full past and future activity in this wallet. Disconnecting stops a website's requests, but a site that has seen these keys can keep following the wallet's activity.

## Good to know

### **Approve only what you started**

On a computer, a connection you just started on a website opens in the wallet by itself. Anything you did not start yourself, reject.

### **The request expired**

Each request stays open for a short time, shown on the website and in the wallet. If it runs out, click Connect wallet again.

### **The wallet could not accept the request**

The website and the wallet are probably on different networks. Switch the wallet to the website's network and connect again.

### **Not now**

If you tap Not now when asked to activate, the website is told and nothing is shared. You can activate later from Home.

### **Disconnect**

Your connected websites are listed under Liquid Connect in the wallet. Disconnect any of them there, or all at once.
